

Users : What abnormality is seen in the kidney?

(Source label: tumor)

Fleming-VL-8B: The CT scan shows a **large, irregularly shaped mass in the right kidney**. This mass is **likely a tumor or other abnormal growth within the kidney**.

Qwen2.5-VL-7B : The renal parenchyma appears to be **heterogeneous**, with areas that are darker and lighter than the surrounding tissue. This might suggest a lesion, **such as a cyst, a tumor, or an area of infarction**. ... A definitive diagnosis would require further evaluation.

Lingshu : The image shows a **large, heterogeneous mass in the right kidney**, which is **likely a renal cell carcinoma**. The mass has areas of necrosis and hemorrhage, indicating an **aggressive and advanced tumor**. The surrounding kidney tissue also appears to be **infiltrated by the tumor, suggesting local invasion**.

InternVL3-8B: The image shows a kidney with a **cyst**. This is evident from the presence of **a well-defined, fluid-filled structure within the kidney tissue**. The cyst appears as a distinct area with different density compared to the surrounding kidney parenchyma, which is typical for **cystic lesions**. While the exact size and number of cysts cannot be determined from this single image, the presence of at least one **cyst is clear**. The surrounding kidney tissue appears normal, **without any obvious signs of other abnormalities such as masses** or significant structural changes. **However, a definitive diagnosis would require further imaging or clinical correlation**.

MEDSAGE: <LOC> The localized region is **[171,163,320,292]** </LOC> <VIS> A **focal mass-like region** with **heterogeneous internal appearance** is visible **in the kidney**. </VIS> <KNO> A focal mass-like renal lesion is an abnormal imaging finding that can support consideration of a renal tumor.</KNO> <CON> **tumor** </CON>
